

Amendments to the Claims

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (Currently amended) A food processor ~~(1)~~, which food processor ~~(1)~~ is equipped with at least two tools ~~(26, 27, 28)~~ for processing food and which, the food processor ~~(1)~~ comprises comprising:

driving means ~~(7)~~ for driving the tools ~~(26, 27, 28)~~, and which food processor ~~(1)~~ comprises

a holder ~~(13)~~ for holding the tools ~~(26, 27, 28)~~, which holder ~~(13)~~ can be driven by the driving means ~~(7)~~ and which holder ~~(13)~~ is equipped with a holder wall ~~(21)~~ and which holder ~~(13)~~ has a window ~~(25)~~ in the holder wall ~~(21)~~, in said window ~~(25)~~ the tools ~~(26, 27, 28)~~ held by the holder ~~(13)~~ can be positioned one at a time, and

wherein the at least two tools ~~(26, 27, 28)~~ are combined combinable to form a tool unit ~~(29)~~, and

wherein the tool unit ~~(29)~~ is designed to be relocatable in relation to the holder ~~(13)~~, and

wherein one tool at a time ~~(26, 27, 28)~~ from the tool unit ~~(29)~~ can be positioned in the window, in which case the at least one other tool ~~(26, 27, 28)~~ is aligned facing towards the holder wall ~~(21)~~ and covered by the holder wall ~~(21)~~, and

wherein releasable a fixing means ~~(30)~~ are is provided for fixing the tool unit ~~(29)~~ to the holder ~~(13)~~.

2. (Currently amended) A The food processor (1) as claimed in claim 1, wherein the tool unit (29) can be relocated essentially parallel with the holder wall (21) following a releasing of the fixing means (30) in relation to the holder (13).

3. (Currently amended) A The food processor (1) as claimed in claim 2, wherein the tool unit (29) can be/is relocatable-relocated essentially at right angles to the holder wall (21) following a releasing of the fixing means (30) in relation to the holder (13).

4. (Currently amended) A The food processor (1) as claimed in claim 2, wherein the holder (13) can be/driven/is drivable by the driving means (7) so as to rotate about a holder axis (14), and has a holder wall (21) running at right angles to the holder axis (14), and wherein, following the a releasing of the fixing means (30), the tool unit (29) can be/rotated/is rotatable about the holder axis (14).

5. (Currently amended) A The food processor (1) as claimed in claim 4, wherein the holder (13) is equipped with a positioning surface (36) adjacent to the holder axis (14), which positioning surface (36) is inclined in relation to the holder wall (21) by an angle of inclination (β), and wherein the tool unit (29) is equipped with/comprises a positioning ring (38) to interact with the inclined positioning surface (36) of the holder (13), and wherein the positioning ring (38) can be fixed with the fixing means (30).

so as to rest against the inclined positioning surface ~~(36)~~, and wherein each tool ~~(26, 27, 28)~~ from the tool unit ~~(29)~~ is inclined at the angle of inclination ~~(β)~~ in relation to the positioning ring ~~(38)~~.

6. (Currently amended) A The food processor ~~(1)~~ as claimed in claim 5, wherein the fixing means ~~(30)~~ are equipped with comprises:

a threaded sleeve ~~(31)~~ that is concentric with the holder axis ~~(14)~~ and is connected to the holder ~~(13)~~, and with

a pressure sleeve ~~(34)~~ that encloses the threaded sleeve ~~(31)~~ and ~~can be relocated~~ is relocatable along the threaded sleeve ~~(31)~~, and with

a screw nut ~~(35)~~ that ~~can be relocated~~ is relocatable along the threaded sleeve ~~(31)~~ by means of a screwing operation, and

wherein the pressure sleeve ~~(34)~~ is equipped with a contact surface ~~(39)~~ inclined by the angle of inclination ~~(β)~~ in relation to the holder wall ~~(21)~~, and

wherein, with the aid of the contact surface ~~(39)~~ of the pressure sleeve ~~(34)~~, the positioning ring ~~(38)~~ can be held against the inclined positioning surface ~~(36)~~ of the holder ~~(13)~~.

7. (Currently amended) A The food processor ~~(1)~~ as claimed in claim 4, wherein the tool unit ~~(29)~~ comprises three tools ~~(26, 27, 28)~~.

8. (New) A food processor comprising:

a plurality of tools configured to process food;
a holder comprising a holder wall and a window in the holder wall, wherein the holder is configured to hold the plurality of tools in said window one at a time,
a driver configured to drive the holder and the plurality of tools;
wherein the plurality of tools are combinable to form a tool unit,
wherein the tool unit is relocatable in relation to the holder, and
wherein one at a time of the plurality of tools from the tool unit is positionable in the window, while other ones of the plurality of tools are aligned facing towards the holder wall and are covered by the holder wall.

9. (New) The food processor as claimed in claim 8, comprising a fixing device configured to fix the tool unit to the holder.

10. (New) The food processor as claimed in claim 9, wherein the tool unit is configured to be relocatable to a position essentially parallel with the holder wall following a releasing of the fixing device in relation to the holder.

11. (New) The food processor as claimed in claim 9, wherein the tool unit is configured to be relocatable to a position essentially

at right angles to the holder wall following a releasing of the fixing device in relation to the holder.

12. (New) The food processor as claimed in claim 2, wherein the holder is drivable by the driver to rotate about a holder axis, and wherein the holder wall is configured at right angles to the holder axis, and wherein, following a releasing of the fixing device, the tool unit is rotatable about the holder axis.

13. (New) The food processor as claimed in claim 4, wherein the holder is equipped with a positioning surface adjacent to the holder axis, which positioning surface is inclined in relation to the holder wall by an angle of inclination, and wherein the tool unit comprises a positioning ring to interact with the inclined positioning surface of the holder, and wherein the positioning ring can be fixed with the fixing means so as to rest against the inclined positioning surface, and wherein each tool of the plurality of tools from the tool unit is inclined at the angle of inclination in relation to the positioning ring.

14. (New) The food processor as claimed in claim 5, wherein the fixing device comprises:

- a threaded sleeve that is concentric with the holder axis and is connected to the holder,

- a pressure sleeve that encloses the threaded sleeve and is relocatable along the threaded sleeve, and

- a screw nut that is relocatable along the threaded sleeve by means of a screwing operation,

wherein the pressure sleeve is equipped with a contact surface inclined by the angle of inclination in relation to the holder wall, and

wherein, with the aid of the contact surface of the pressure sleeve, the positioning ring can be held against the inclined positioning surface of the holder.

15. (New) The food processor as claimed in claim 4, wherein the tool unit comprises three tools.
